# WELCOME TO REMEHA, THE EXPERT CHOICE

WE LEAD THE WAY IN INNOVATION, RELIABILITY AND EFFICIENCY  
FOR ADVANCED COMMERCIAL HEATING SOLUTIONS.

We're completely focused on commercial heating solutions and are at the forefront of condensing gas boiler technology – we don't manufacture boilers for anyone else.

We invest heavily in research and development which enables our specialist teams to design high performance products at every level. From using the latest materials and manufacturing techniques to meticulously designing and engineering each boiler, we ensure they're efficient to specify, install, run and maintain.

All our boilers share the same simple design – so they're expandable, adaptable and future-proofed.

We've tried to think of everything, so from specification to blueprint sign-off through to supply and installation, our customer service and product support is our number one priority.

## INTRODUCING THE REMEHA GAS 310/610 ECO PRO RANGE

The Gas 310/610 Eco Pro range features compact, floor-standing, gas-fired, high efficiency condensing boilers (available in five to ten section models from 285 to 1300 kW).

Their small footprint and ability to be installed side-to-side makes them ideally suited for modular configuration while the secondary return feature makes this boiler suitable for use with both CT and VT circuits. An optional optimising weather compensating control package can also ensure maximum efficiency.

These boilers are suitable for both new and retrofit applications. With conventional and room-sealed capability, they can be installed in most situations.

### FEATURES AND BENEFITS

<b>Integral flue gas non-return valve</b>	Multiple flues can use the same riser without risk of cross contamination
<b>High efficiency boiler-up to 96.64% GCV</b>	Higher than average energy-savings
<b>Compact, lightweight construction</b>	Easy to install in smaller spaces; particularly suitable for retrofit applications
<b>Easy disassembly/reassembly and has integrated wheels</b>	Improved ease of installation especially where access is restricted
<b>Ultra-low Class 5 NO<sub>x</sub> emission levels of 36mg/kWh 0% O<sub>2</sub> dry and under</b>	Low pollutant emissions that meet environmental regulations including BREEAM, and Clean Air Act
<b>Pre-mix down-firing gas burner, one-piece cast aluminium heat exchanger with ultra-low NO<sub>x</sub> emissions</b>	Clean, trouble-free operation and optimum combustion
<b>Digital diagnostic display and remote signalling options</b>	Easy maintenance
<b>Remeha's boiler control includes:</b> • modulating 18-100% • compatible with OT Open Therm • 0-10V or volt free	Built-in flexibility for easy installation and efficient, reliable heat delivery
<b>Optional secondary return kit</b>	For use with both CT and VT circuits
<b>Quiet operation ≤68 dB(A)</b>	Improved comfort
<b>Left or right hand version (Gas 310 Eco Pro)</b>	Greater flexibility of plant room planning

## GAS 310/610 ECO PRO OPERATING PRINCIPLE

Combustion air is drawn into the inlet connection from the plant room (conventionally flued) or from outside via the concentric flue system (room-sealed) by an air supply fan. On the inlet side of the fan is a specially designed chamber (Venturi unit) which takes gas from the multiblock and mixes it in the correct ratio with the incoming air.

This mixing system ensures that the correct gas/air ratio is delivered to the pre-mix burner at all times. Depending on demand (under the dictates of flow/return sensor and other external/internal control inputs) the system determines the required boiler output. The control then varies the speed of the air supply fan which alters the volume of air being drawn into the Venturi. This change in volume is measured using air pressure differential which directly controls the volume of gas also being delivered to the Venturi. The resultant controlled mixture is delivered to the pre-mix burner.

This mixture is initially ignited by the combined ignition/ionisation probe, which monitors the state of the flame. If the flame is unstable or doesn't ignite within the pre-set safety time cycle, the controls will, after five attempts, shut the boiler down requiring manual intervention to reset the boiler. The digital display will indicate a flashing fault code confirming the reason for the failure. The products of combustion in the form of hot flue gases are forced through the heat exchanger transferring their heat to the system water (the flue gas temperature is reduced to approximately 5-8°C above the temperature of the system return water) then discharged via the condensate collector, to the flue gas outlet connection – and then into the atmosphere.

A vapour cloud will form at the flue gas terminal due to the low flue gas exit temperature. When the flue gas temperature falls below dew point (55°C), water vapour created during the combustion process will begin to condense out in the boiler, transferring its latent heat into the system water, increasing the output of the boiler without increasing the gas consumption. Condensation formed within the boiler and flue system is discharged from the boiler to an external drain via the drain pan and siphon supplied.

# SUGGESTED ENGINEERING SPECIFICATION

## GAS 310 ECO PRO

### □ CONSTRUCTION

The boiler will consist of a sectional cast aluminium heat exchanger with other major components contained within a rigid steel frame with removable casing parts for maintenance purposes. The boiler will come complete with wheels to enable the assembled unit to be easily manoeuvred into position within the plant room on site with the minimum of effort. All major electrical and electronic controls shall be contained within the instrument panel mounted on top of the boiler at the opposite end to the connections facing to the front (long side) but can be rotated 90° towards the short side to suit site location. The boiler shall be able to pass through 720mm standard door and shall be delivered fully assembled.

### □ HYDRAULIC, GAS AND FLUE CONNECTIONS

The boiler will be available with flow and return connections on the left or right hand end of the boiler (this must be decided during coordination), with the gas connection on the top of the boiler. The flue gas outlet, complete with a condensate connection shall be at a low level on the same end as the F/R connections. The combustion air inlet is located at the top of the boiler. The boiler will be suitable for room-sealed or conventional flue applications and designed to operate at working pressures not exceeding seven bar.

### □ OPERATION

The boiler shall come complete with a modulating control system that limits the maximum difference in temperature between the heating flow and return and the maximum speed at which the flow temperature increases. The boiler shall come complete with a pre-mix burner (NG) with the gas/air ratio control system controlled internally. An intelligent, advanced boiler control shall continuously monitor the boiler conditions, varying the heat output to suit the system load. The controls shall be able to react to external negative influences in the rest of the system (flow rates and air/gas supply problems) maintaining boiler output for as long as possible without resorting to a lock out condition. Should a negative effect happen in the system the boiler shall reduce its output and/or shut down (shut-off mode), awaiting the negative conditions to return to normal before re-starting. The control cannot override the standard flame safety controls. Standard frost protection shall activate below 7°C with stage one activating the system/shunt pump. Stage two shall activate below 3°C with boiler switching on to 10°C flow.

### □ CONTROLS

The boiler will include a controls package that allows the actual and set values to be read and adjusted on the built-in digital display, which also provides normal operating and fault code indication. The controls shall come as standard with the following inputs/outputs:

- 0-10V input (flow or load control)
- Common alarm
- High limit lock out
- External gas valve control (optional)
- Low water protection (optional)
- Frost protection
- External pump control
- Hydraulic pressure sensor (optional)
- Shutdown interlock
- Min gas pressure switch (optional)
- Release input
- Volt free (enable signal)
- Open therm control.

### □ FEATURES

- Ultra-low NO<sub>x</sub> <36mg/kWh
- Fully modulating
- Quiet operation <52dB(A)
- Supplied on fully built-in wheels
- Air pressure differential sensor (LDS)
- ErP compliant
- Digital diagnostic display
- Pre-mix burner
- Left or right hand versions available
- In-built passive flue gas non-return valve.

### □ DIMENSIONS AND CONNECTIONS

The small footprint of this range alongside its easy disassembly and its space saving configurations, makes it ideal for modular arrangement and particularly suitable for retrofit applications.

## GAS 610 ECO PRO

### □ CONSTRUCTION

The boiler will consist of a sectional cast aluminium heat exchanger with other major components contained within a rigid steel frame with removable casing parts for maintenance purposes. The boiler will consist of two modules connected together to share the same air-box. Each section is able to perform independently to each other and should one module go to fault the other will remain operational. The boiler will be complete with wheels to enable the assembled unit to be easily manoeuvred into position within the plant room on site with the minimum effort. All major electrical and electronic controls shall be contained in the instrument panel mounted on top of the boiler at the opposite end to the connections facing to the front (long side) but can be rotated 90° towards the short side to suit site location. The boiler will be able to pass through 720mm wide standard door fully assembled in two sections to allow ease of positioning.

### □ HYDRAULIC, GAS AND FLUE CONNECTIONS

The boiler will be available with flow and return connections on the left or right hand end of the boiler (this must be decided during coordination), with the gas connection on the top of the boiler. The flue gas outlet, complete with a condensate connection shall be at low level on the same end as the F/R connections. The combustion air inlet is located at the top of the boiler. The boiler will be suitable for room-sealed or conventional flue applications and designed to operate at working pressures not exceeding seven bar. The boiler will have two flows and returns at one end with a combined flue gas outlet. The control panel will be rotated to enable the boiler connections to be on the left or right hand side.

### □ OPERATION

The boiler will come complete with a modulating control system that limits the maximum difference in temperature between the heating flow and return and the maximum speed at which the flow temperature increases. The boiler will come complete with a pre-mix burner (NG) with the gas/air ratio control system controlled internally. An intelligent, advanced boiler control shall continuously monitor the boiler conditions, varying the heat output to suit the system load. The control will be able to react to external negative influences in the rest of the system (flow rates and air/gas supply problems) maintaining boiler output for as long as possible without resorting to a lock out condition. Should a negative effect happen in the system the boiler shall reduce its output and/or shut down (shut-off mode), awaiting the negative conditions to return to normal

before re-starting. The control cannot override the standard flame safety controls. Standard frost protection shall activate below 7°C with stage one activating the system/shunt pump. Stage two shall activate below 3°C with the boiler switching on to 10°C flow.

### □ CONTROLS

The boiler will include a controls package that allows the actual and set values to be read and adjusted on the built-in digital display, which also provides normal operating and fault code indication. The controls shall come as standard with the following inputs/outputs:

- 0-10V input (flow or load control)
- Common alarm
- High limit lock out
- External gas valve control (optional)
- Low water protection (optional)
- Frost protection
- External pump control
- Hydraulic pressure sensor (optional)
- Shutdown interlock
- Min gas pressure switch (optional)
- Release input
- Volt free (enable signal)
- Open therm control.

### □ FEATURES

- Ultra-low NO<sub>x</sub> <36mg/kWh
- Fully modulating
- Quiet operation <52dB(A)
- Supplied on fully built-in wheels
- Air pressure differential sensor (LDS)
- ErP compliant
- Digital diagnostic display
- Premix burner
- In-built passive flue gas non-return valve.

### □ DIMENSIONS AND CONNECTIONS

The small footprint of this range alongside its easy disassembly and its space saving configurations, makes it ideal for modular arrangement and particularly suitable for retrofit applications.

## GAS 310 ECO PRO DIMENSIONS

BOILER TYPE	A (MM)	B (MM)	C (MM)	L (MM)
310-285 (5)	1833	1635	1862	1490

### KEY

	Heating circuit flow (80mm); Flange NW 80 (Standard DIN 2576)
	Heating circuit return (65mm); Flange NW 80 (Standard DIN 2576)
	Gas connection; G2" (Female thread)
	Condensates discharge; 32mm (Internal)
	Flue gas outlet; Ø 250mm
	Air intake; Ø 250mm
	Second return (optional); Flange NW 80 (Standard DIN 2576)

Note: Heating flow pipe 80mm with a mating flange NW 80 (PN16). Return flow pipe 65mm with a mating flange NW 80 (PN16). The optional return pipe is also 65mm, and fitted with a NW80 (PN16) mating flange. The service areas are shown on page 20.

GAS 310  
ECO PRO  
CONFIGURATION

The service side with the inspection hatch on the heat exchanger is considered to be the front of the boiler. This boiler is available in both a left-hand and right-hand version. This means that the hydraulic connections and the flue gas discharge are situated on either the left or the right-hand side of the boiler. The control panel is on the front as standard, but can easily be rotated so that it is on the short side. To make the boiler level and to raise the wheels off the floor, the adjustment jacks must be used. Turn the adjustment bolts out as soon as the boiler is placed in the correct position. The picture shows the support surface of the boiler. This is the position of the adjustment bolts.

Note: Heating flow pipe 80mm with a mating flange NW 80 (PN16). Return flow pipe 65mm with a mating flange NW 80 (PN16). The optional return pipe is also 65mm and fitted with a NW80 (PN16) mating flange.

GAS 610  
ECO PRO  
CONFIGURATION

The Gas 610 Eco Pro boiler is not available with a choice between left or right hand versions, but the control panel can easily be rotated to enable the boiler connections to be on the left or right hand side. To make the boiler level and to raise the wheels off the floor, the adjustment bolts must be used. Turn the adjustment bolts out as soon as the boiler is placed in the correct position. The picture shows the support surface of the boiler. This is the position of the adjustment bolts.

## GAS 310/610 ECO PRO DIMENSIONS

The wheels are designed for transport purposes only and not for use when the boiler is in its final position. If required for internal transport, the boiler can be dismantled into smaller parts for transport. The boiler can be stripped of:

- casing components
- gas/air components
- the frame section on the instrument panel side.

T003474-B

Diagram shows position of support feet.

T003676-B

### GAS 310/610 ECO PRO

BOILER TYPE	A (MM)

310-575/610-1150	1469
310-650/610-1300	1469

See the diagram and table for the dimensions of the largest remaining transport part, the frame section with heat exchanger and water connections. For information on fitting the parts, refer to the assembly instructions delivered with the boiler.

SPACE SAVING  
CONFIGURATIONS

The Gas 310/610 can be configured in a multitude of ways.  
Examples below:

\*Indicates spacing required if this is the operating side.

# GAS 310 ECO PRO MAINTENANCE AREAS

For the dimensions of C/C1, see page 14.

T003499-B

\*Spacing required if this is operating side.

GAS 610  
ECO PRO  
MAINTENANCE  
AREAS

For the dimensions of C/C1, see page 18.

A technical clearance of at least 80cm is required at the front (service side) of the boiler. However, we recommend that the clearance is at least 100cm. We recommend a clearance of at least 40cm above the boiler. If the air supply filter is used, there must be a clearance of at least 65cm. A minimum of 30cm is required on the side of the flue gas discharge, and a minimum of 30cm is also required on the other side, or 80cm, if this is the operating side.

T003768-E

\*Spacing required if this is operating side.

# SINGLE GAS 310 ECO PRO TYPICAL INSTALLATION

Using the optional secondary return

# MULTIPLE BOILER GAS 310 ECO PRO TYPICAL INSTALLATION

Using the optional secondary return

Typical diagrams shown do not constitute a full system design and should be used for general concept information only. All equipment should be installed to manufacturer's instructions and must comply with current regulations in force.

# ELECTRICAL CONNECTIONS AND CONTROLS

## □ GENERAL

General specifications apply to the Gas 310 Eco Pro and to the Gas 610 Eco Pro. These boilers are supplied as standard with electronic operating and flame ionisation safety controls with a specially designed microprocessor at the heart of the system. The boilers are pre-wired. All external connections can be made on the terminal strips.

## □ POWER SUPPLY

The boilers are suitable for a 230V-50Hz supply with phase/neutral/earth. Other connection values are only acceptable if an isolating transformer is installed. The boilers are sensitive to phase/neutral and therefore have a facility to ensure that phase and neutral are correctly connected.

## □ AUTOMATIC CONTROLS

The Gas 310/610 Eco Pro has a unique boiler code. This together with other data (including boiler type, counter readings, etc.) is stored in a code-key that belongs to the boiler. If the control unit is replaced, the counter readings remain stored in the code-key.

## □ TEMPERATURE CONTROL

The boiler is equipped with electronic temperature control based on flow, return, and boiler block temperature sensors. The flow temperature can be set between 20 and 90°C. The boiler reduces its power when the set outlet-temperature is attained. The cut out temperature is the set heating outlet-temperature + 5°C.

## □ LOW WATER LEVEL PROTECTION (FLOW AND CONTENT)

The boiler is fitted with a safety device to prevent the shortage of water based on temperature measurements (temperature difference between flow and return).

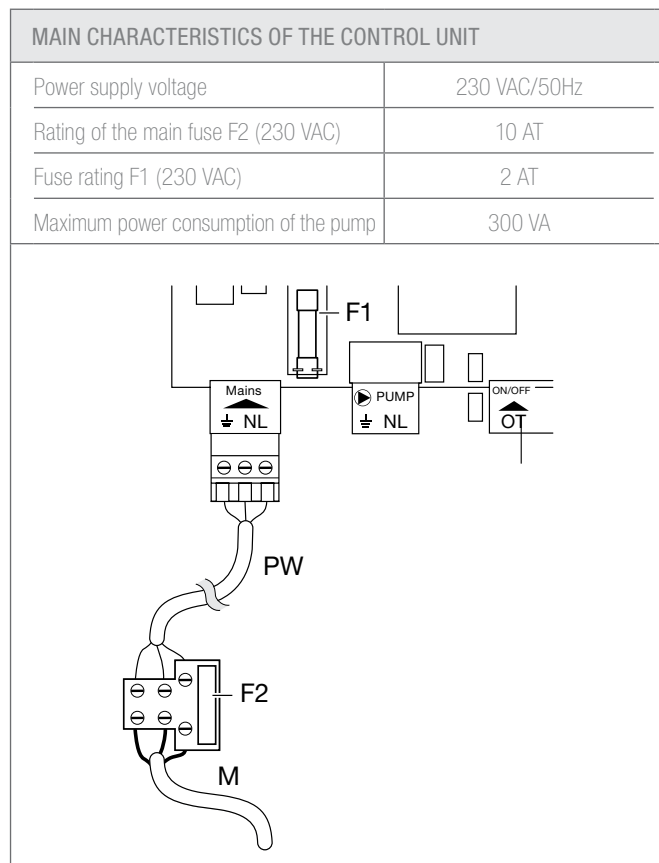

If  $\Delta t = 25K$  is reached (factory setting), the boiler reduces its output by modulating to remain in operation as long as possible.

If  $\Delta t \geq 25K$  the boiler goes into part load.

If  $\Delta t > 25 + 5K$  the boiler goes into a normal control stop (temporary shutdown).

## □ HIGH LIMIT PROTECTION

The maximum temperature protection switches the boiler off if the water temperature is too high (110°C) and locks it on the control box. The minimum off time is preset to a fixed value (\*1 seconds). Once the fault has been rectified, the boiler can be reset by pressing the reset button for two seconds.

N	Neutral	HLs	Safety thermostat	FAN	Fan

# SAFETY INTERLOCKS

This applies to the Gas 310 Eco Pro and to each module on the Gas 610 Eco Pro. The boilers are supplied with two interlocks as standard.

## □ SHUTDOWN INTERLOCK

A shutdown interlock carrying a 24 Volt AC boiler control circuit. This input does not require manual reset. Any external devices required to stop the boiler (e.g. limit switches of throttling valves, minimum gas pressure switches) should be wired in series and connected to terminals BL. Breaking the circuit will activate the safety interlock and put the boiler into a shut off condition.

## □ RELEASE INPUT

A lockout interlock carrying a 24 Volt AC boiler control circuit. This input requires manual reset if activated. Any external devices required to stop the boiler (e.g. maximum gas pressure switch) must be volt free and should be wired in series and connected to terminals RL. Closing the circuit will activate the safety interlock.

## □ HYDRAULIC PRESSURE SENSOR (WPS)

The hydraulic pressure sensor registers the water pressure and can shut the boiler down when the minimum water pressure is reached. To activate this blocking option, a minimum pressure must be set with parameter P 2 8 (Factory setting 0 = off). Connect the hydraulic pressure sensor to the WPS terminals of the terminal strip.

0 = Earth or neutral of the power supply  
S = Signal or output from the sensor  
+ = Supply voltage

## □ OPERATION SIGNAL

As standard the boilers are supplied with internal relays to indicate boiler run. Contact load:

- Maximum voltage: 230 Volts
- Maximum current: 1 Amp.

## □ COMMON ALARM (LOCKOUT)

As standard, the boilers are supplied with an internal change over relay to indicate common alarm. The relay contacts are volt free and can be connected to confirm operation with closed or open contacts. Contact load:

- Maximum voltage: 230 Volts
- Maximum current: 1 Amp.

## □ EXTERNAL GAS VALVE CONTROL

If there is a heat demand, an alternating voltage of 230 VAC, 1 Amp (maximum) becomes available on the EgV terminals of the connector to control an external gas valve. Additional external interlocks (by others) may be required in a multi boiler installation.

**IMPORTANT!** This supply cannot be used to control an external gas valve if it supplies other appliances. Contact load:

- External gas valve voltage: 230 Volts
- Maximum current: 1 Amp.

## □ OPTIONAL ACCESSORIES

- Hydraulic pressure sensor
- Minimum gas pressure switch
- Second return
- Cleaning tool
- Water pressure sensor adaptor
- Gas leak switch (VPS)
- Air filter
- Recom kit
- Combined roof flue kit for flue 250mm/200.

## □ BOILER PUMP CONTROL

The Gas 310/610 Eco Pro boilers have terminals, which can be used to connect an external boiler pump. This pump runs once every 24 hours to prevent sticking (24-hour pump operation).

Two options are available:

1. System pump connect to pump terminals on PCU – 06 max 300VA
2. Shunt pump connect to terminal on PCU – S05 plug x 03 max 300VA.

## □ INSTALLATION SHUTDOWN

If the central heating system is not used for a long period, we recommend switching the boiler off.

- Switch the on/off switch to off
- Switch off the boiler electrical power supply
- Shut off the gas supply
- Ensure that the boiler and system are protected against frost damage.

**CAUTION:** In the event of low temperatures, we recommend that the installation continues to operate at a lower temperature. This prevents freezing.

## □ FROST PROTECTION

**CAUTION:** Drain the boiler and central heating system if you are not going to use the building for a long time and there is a chance of frost.

For shorter periods: if there is no demand for heat, the boiler will only switch on in order to prevent frost damage. When the heating water temperature in the boiler falls by too much, the integrated protection system in the boiler starts up. This protection functions as follows:

- The circulation pump switches on if the water temperature is lower than 7°C (if pump is electrically connected to the boiler)
- If the water temperature is lower than 4°C, the boiler starts up
- If the water temperature is higher than 10°C, the boiler shuts down and the heating pump continues to run for a short time.

**CAUTION:** The integrated protection system only protects the boiler, not the installation.

# BOILER CONTROLS

The Gas 310/610 Eco Pro boilers can be controlled using one of the following methods:

Note: This applies to each module on the Gas 610 Eco Pro.

## □ ON/OFF CONTROL

### GAS 310 ECO PRO

(One x NO VOLT FREE SWITCHED PAIR)

The heat output modulates between the minimum and the maximum value based on the set flow temperature, connected to ON/OFF – OT on PCU-06.

### GAS 610 ECO PRO (TWO SETS)

(Two x NO VOLT FREE SWITCHED PAIR)

The heat output modulates between the minimum and the maximum value based on the set flow temperature, connected to ON/OFF – OT on PCU-06.

## □ MODULATING

Fully modulating, where the output modulates between the minimum and maximum value on the basis of the flow temperature defined by the modulating controller.

Note: When using on/off control the boiler will also modulate to maintain the flow temp set point.

- Analogue control (0-10 volts), where the heat output or temperature is controlled by a 0-10 volt signal.
- ON/OFF control, (one volt free relay) where the heat output modulates between the minimum and maximum value on the basis of the flow temperature set in the boiler. In all cases, modulation is based on the required flow temperature and there is a  $\Delta t$  dependent output control with the following characteristic. Up to a  $\Delta t$  of 10 to 30°C (factory setting, parameter P45) the boiler operates at full capacity. Between  $\Delta t$  full load and  $\Delta t$  part load the output reduces in linear fashion.

## MODULATING CONTROLS GENERAL (TWO WIRE CONTROL)

To make full use of the boiler's modulating feature, iSense controls can be connected. These controls will provide optimised time and weather compensation to achieve maximum efficiency and minimum boiler cycling whilst maintaining design conditions within the building.

Single and multiple optimising/weather compensating boiler controls are available for one or multiple boilers (up to a max of eight x Gas 310 Eco Pro or four x Gas 610 Eco Pro).

These compensators can regulate the boiler output against outside weather conditions and provide time and temperature control over the direct hot water (DHW).

The compensator is mounted in one of the boilers and is interfaced to communicate with the boiler's controls via the supplied adapter.

On-site connection of the supplied outside and common flow sensors completes the installation.

Note: Please refer to the relevant control leaflet for optimising/compensation settings.

## □ ANALOGUE INPUT (0-10)

The function of the analogue input can be set using parameter P 3 7. This control can be based on temperature or heat output. If this input is used for 0-10 V control, then the boiler OT communication is ignored.

### ANALOGUE TEMPERATURE-BASED CONTROL (°C)

The 0-10 V signal controls the boiler flow temperature. This control modulates on the basis of flow temperature, whereby the heat output varies between the minimum and maximum values on the basis of the flow temperature set point calculated by the controller.

INPUT SIGNAL (V)	TEMP °C	DESCRIPTION
0-1.5	0-15	Boiler off
1.5-1.8	15-18	Hysteresis
1.8-10	18-100	Temperature required

### ANALOGUE HEAT OUTPUT-BASED CONTROL (%)

The 0-10 V signal controls the boiler output. The minimum and maximum values are limited. The minimum output is linked to the boiler's modulation depth. The output varies between the minimum and maximum value on the basis of the value determined by the controller.

INPUT SIGNAL (V)	HEAT OUTPUT %	DESCRIPTION
0-2.0*	10-20	Boiler off
2.0-2.2*	20-22	Hysteresis
2.0-10*	20-100	Heat output supplied

\*Dependent on the minimum modulation depth (set speeds, standard 20%)

## □ ANALOGUE OUTPUT (0-10)

The function of the analogue output can be set using parameter P 3 6. An outgoing 0-10 V signal can be used either to report the supplied heat output or the supplied temperature. The speed of the system pump can be controlled with an outgoing 0-10 V signal (only possible if the pump is suitable for this).

### CONTROL OF 0-10 V WILO SYSTEM PUMP

#### KEY

R	Pump speed
min	Minimum pump speed
max	Maximum pump speed
Off	The pump is off
U	Output signal (V)

OUTPUT SIGNAL (V)	DESCRIPTION

# GAS 310 ECO PRO

## FLUE DATA

### □ OPEN FLUE (B23, B23P)

If using an open version, the air supply opening remains open; only the combustion gas opening is connected. The boiler then takes in the combustion air required directly from the plant room in which it is installed. For the application of air discharge and combustion gas discharge flue with a diameter other than 250mm, a reducer should be used. If the boiler, in room ventilated operation, has been set up in a (very) dusty room, use the air supply filter (accessory).

CAUTION: The air supply opening must remain open. The premises in which the appliance is installed must be fitted with the necessary air supply openings. They must not be reduced or closed.

CHIMNEY LENGTH FOR THE OPEN VERSION – GAS 310 ECO PRO

BOILER TYPE	MAXIMUM LENGTH (L) <sup>1</sup>			
	WITH A Ø OF 150MM	WITH A Ø OF 180MM	WITH A Ø OF 200MM	WITH A Ø OF 250MM

## TECHNICAL SUPPORT

From brochures to CAD drawings and BIM files, you can access all the information you need at [remeha.co.uk](http://remeha.co.uk).

Or call our sales or technical departments on **0118 978 3434**. We're always happy to help.

We can provide you with:

- Brochures
- Technical specification sheets
- Case studies
- Installation manuals
- BIM files
- CAD files
- Energy-related Products Directive data
- Commissioning
- Technical information
- Spare parts (after sales).

## DECLARATION OF COMPLIANCE

We hereby certify that the series of appliances specified herein is in compliance with the standard model described in the EC declaration of compliance, and that it is manufactured and marketed in compliance with the requirements and standards of the following European Directives.

- 90/396/EEC Gas Appliances Directive
- 92/42/EEC Efficiency Directive
- 89/336/EEC E.M.C. Directive.

And complies with the following requirements:

- 73/23/EEC Electrical Low Voltage Directive
- 97/23/EEC Pressure Equipment Directive

Article 3, Sub.3

CE Certification

Reference number 0085BS0132

NO<sub>x</sub> – Reference Number BS004

ErP Compliant

The unit has been inspected for compliance with the essential requirements of the following directives:  
CE identification number (PIN): 0063CL3613

NO<sub>x</sub> Class: 5.
